

My 5-year old braai was in desperate need of a makeover. The paint was dull and faded and there were quite a few rusty areas that required immediate attention.

1. CLEAN AND SAND

Disassemble the braai. Scrub well to remove all traces of grease. I used Johnson's Speed Strip - available at supermarkets - to get rid of built up grease. Use a Bosch Multi Sander and 120-grit sandpaper to remove rusty areas and loose or peeling paint.

2. APPLY PRIMER

Paint all metal surfaces with Rust-Oleum Stops Rust Clean Metal Primer and allow to dry. Spray on two coats of Rust-Oleum High Heat or High Heat Ultra, allowing drying time between coats.

3. I used my **Dremel MultiTool** to get into small areas. Use the #538 Abrasive Brush accessory for cleaning off any rust or build up of grease.

4. All the old wood was replaced with new pine sections. The wood was treated with three coats of **Woodoc 35 Low Gloss Polywax Sealer** on tops, bottoms and sides, to protect from moisture and UV damage.

Rust-Oleum Stops Rust Clean Metal Primer provides rust protection to clean or lightly rusted metal. Apply directly over rust to allow superb adhesion for finishes. Works with bare or previously painted metal.

HIGH HEAT ULTRA is a superior rust-preventive enamel that provides deep colour, rich sheen and the best protection for high heat surfaces. This durable semi-gloss finish gives metal surfaces a premium look along with excellent gloss and colour retention after repeated heating. It withstands temperatures of up to 1200 degrees (648C). Ideal for braai grills, wood stoves, radiators, firepits, fireplace screens, automotive parts and more.

Rust-Oleum Stops Rust® Clean Metal Primer and Speciality High Heat are available at Mica, Mega Mica, Jack's Paint and select hardware stores.
